Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were randomly assigned to a control group (CG) and an exercise group (EG). The EG performed a 10-week training program consisting of 3 sessions per week of 30 min of aerobic exercise at 70% of their maximum heart rate. The CG did not exercise. The HR and HRR were measured at rest and during a maximal exercise test at baseline and after 10 weeks. The EG showed a significant decrease in HR at rest and during maximal exercise, and a significant increase in HRR at rest and during maximal exercise, compared to the CG. The results suggest that a 10-week training program can improve the cardiovascular fitness of sedentary middle-aged men.

Figure 1

1. **Identify the main topic of the text.**
 2. **Summarize the main points of the text.**
 3. **Identify the author's purpose in writing the text.**
 4. **Identify the author's tone in writing the text.**
 5. **Identify the author's audience in writing the text.**
 6. **Identify the author's main argument or thesis.**
 7. **Identify the author's supporting evidence.**
 8. **Identify the author's conclusion.**
 9. **Identify the author's main point or message.**
 10. **Identify the author's main conclusion or recommendation.**
